In statistical mechanics, entropy is an extensive property of a thermodynamic system. It is closely related to the number Ω of microscopic configurations (known as microstates) that are consistent with the macroscopic quantities that characterize the system (such as its volume, pressure and temperature).

Entropy - Wikipedia

In thermodynamics, entropy is commonly associated with the amount of order, disorder, or chaos in a thermodynamic system. This stems from Rudolf Clausius' 1862 assertion that any thermodynamic process always "admits to being reduced [reduction] to the alteration in some way or another of the arrangement of the constituent parts of the working ...

where $\ln \Omega$ is the natural logarithm. The entropy is non-negative and is at most the natural log of the number of elements in X . Entropy is a fundamental concept in information theory: in the paper that originated that field, Shannon (1948) described entropy as "a measure of how much 'choice' is involved in the selection of an event".

High entropy alloys (HEAs) are barely 12 years old. The field has stimulated new ideas and has inspired the exploration of the vast composition space offered by multi-principal element alloys (MPEAs).
